Plagiarism is when an author attempts to pass off someone else's work as his or her own. Duplicate publication, sometimes called self-plagiarism, occurs when an author reuses substantial parts of his or her own published work without providing the appropriate references. This can range from getting an identical paper published in multiple journals, to 'salami-slicing', where authors add small amounts of new data to a previous paper.

The Archives of Bone and Joint Surgery is now using DocCop (www.doccop.com) to test the degree of plagiarism and then manuscripts will be reviewed by the Administrative Office for any probable plagiarism.

Since many papers have multiple authors, the only way for the guarantor author to know that the final paper does not contain plagiarized text is to run it through a program like Doc Cop prior to submission.

If a case of plagiarism comes to light after a paper is published, the journal will conduct a preliminary investigation. If plagiarism is found, the journal will contact the author's institute and funding agencies. A determination of misconduct will lead the journal to run a statement, bidirectionally linked online to and from the original paper, to note the plagiarism and to provide a reference to the plagiarised material. Depending on the extent of the plagiarism, the paper may also be formally retracted.
